

LISTING OF THE CLAIMS

Claims 1-39 are pending. Please amend claim 23. No claims are canceled, added, or withdrawn.

The following listing of claims replaces all prior versions and listings of claims in the application.

1. (Original) A method providing topology control to a distributed wireless multi hop network comprising a plurality of nodes, the method comprising:

for each node, discovering a set of neighboring nodes of the nodes using a set of incoming signals from the neighboring nodes, the incoming signals being responsive to receipt by the neighboring nodes of an outgoing signal from a respective node of the nodes;

for each node, making a respective decision about a substantially optimal transmission power to communicate with at least one subset of the neighboring nodes, the respective decision being based on the incoming signals and being independent of positional information;

for each node, maintaining communications with the at least one subset to provide connectivity between each of the nodes.

2. (Original) A method as recited in claim 1, wherein collectively each respective decision provides substantially complete connectivity between the nodes in a power efficient manner.

1 3. (Original) A method as recited in claim 1, wherein an incoming
2 signal comprises directional information.

3
4 4. (Original) A method as recited in claim 1, wherein an incoming
5 signal comprises directional information and an indication of transmission power
6 used by a neighboring node of the neighboring nodes to communicate the
7 incoming signal.

8
9 5. (Original) A method as recited in claim 1, further comprising:
10 identifying a particular cone of degree α that is within a boundary node's
11 transmission radius that is not covered by at least one other node of the nodes, α
12 being less than or equal to $5\pi/6$; and

13 decreasing the boundary node's transmission radius to exclude other nodes
14 of the nodes that were acquired within the boundary node's transmission radius as
15 part of an attempt to communicate with a nodes of the nodes in the particular cone.

16
17 6. (Original) A method as recited in claim 1, further comprising:
18 detecting a change in topology of the wireless multi-hop network by a first
19 node of the nodes, the change corresponding to a second node of the nodes
20 entering or leaving a radius of coverage corresponding to the first node; and
21 responsive to detecting the change, dynamically reconfiguring the at least
22 one subset of nodes with which the first node maintains communications to
23 provide collective connectivity between each of the nodes in a manner that reflects
24 the change.
25

1 7. (Original) A method as recited in claim 1, further comprising
2 removing a special edge from the wireless multi-hop network, an edge being a
3 communication pathway between two nodes of the nodes, and wherein an edge is
4 a special edge if: (a) a first node of the at least two nodes is inside of a first
5 transmission radius that corresponds to a second node of the at least two nodes;
6 and (b) the second node is outside of a second transmission radius that
7 corresponds to the first node.

8
9 8. (Original) A method as recited in claim 1, wherein discovering the
10 neighboring nodes further comprises:

11 broadcasting the outgoing signal in all directions at a portion of a
12 substantially optimal termination power;

13 receiving the incoming signals; and

14 wherein making the respective decision further comprises:

15 determining whether a predetermined criteria has been met; and

16 responsive to determining that the predetermined criteria has not been met:

17 (a) increasing the portion by a quantum;

18 (b) re-broadcasting the outgoing signal at the portion;

19 (c) receiving a set of incoming signals;

20 (d) determining whether the predetermined criteria has been met; and

21 (e) responsive to determining that the predetermined criteria has not been
22 met, repeating (a) through (e) until either the predetermined criteria is met or until
23 the portion reaches the substantially optimal termination power.

1 9. (Original) A method as recited in claim 8, wherein the substantially
2 optimal termination power is less than or equal to a node's maximum transmission
3 power.

4
5 10. (Original) A method as recited in claim 8, wherein the
6 predetermined criteria is based on identifying at least one node of the neighboring
7 nodes within each of a plurality of cones of degree α , each cone being centered on
8 the respective node and spanning a degree of $\alpha/2$ on each side of the at least one
9 node, the cones collectively spanning 2π degrees around the respective node.

10
11 11. (Original) A method as recited in claim 10, wherein $\alpha \leq 5\pi/6$.

12
13 12. (Original) A method as recited in claim 1, wherein an edge is a
14 communication pathway between at least two nodes of the nodes, wherein
15 connectivity in the multi-hop network is represented by a plurality of edges in a
16 topological graph, and wherein the method further comprises removing a
17 redundant edge from the wireless multi-hop network.

13. (Original) A method as recited in claim 12, wherein removing the redundant edge further comprises:

assigning each edge (u, v) an edge ID as represented by:

$eid(u, v) = (i1, i2, i3)$,

where $i1 = d(u, v)$, $i2 = \max(\text{node IDs of } u \text{ and } v)$, and $i3 = \min(\text{node IDs of } u \text{ and } v)$; and

comparing edge IDs based on lexicographical order, wherein given any $\theta \leq \pi/3$ and given any pair of edges (u, v) and edges (u, w) such that angle $vuw < \theta$, a communication pathway between nodes (u, v) is a redundant edge if a first edge ID of (u, v) is greater than a second edge ID (u, w).

14. (Original) A computer-readable medium comprising computer-executable instructions providing topology control to a distributed wireless multi hop network comprising a plurality of nodes, the computer-executable instructions comprising instructions for:

for each node, discovering a set of neighboring nodes of the nodes using a set of incoming signals from the neighboring nodes, the incoming signals being responsive to receipt by the neighboring nodes of an outgoing signal from a respective node of the nodes;

for each node, making a respective decision about a substantially optimal transmission power to communicate with at least one subset of the neighboring nodes, the respective decision being based on the incoming signals and being independent of positional information;

for each node, maintaining communications with the at least one subset to provide connectivity between each of the nodes.

1 15. (Original) A computer-readable medium as recited in claim 14,
2 wherein collectively each respective decision provides substantially complete
3 connectivity between the nodes in a power efficient manner.

4
5 16. (Original) A computer-readable medium as recited in claim 14,
6 wherein an incoming signal comprises directional information.

7
8 17. (Original) A computer-readable medium as recited in claim 14,
9 wherein an incoming signal comprises directional information and an indication of
10 transmission power used by a neighboring node of the neighboring nodes to
11 communicate the incoming signal.

12
13 18. (Original) A computer-readable medium as recited in claim 14,
14 wherein the computer-executable instructions further comprise instructions for:

15 detecting a change in topology of the wireless multi-hop network by a first
16 node of the nodes, the change corresponding to a second node of the nodes
17 entering or leaving a radius of coverage corresponding to the first node; and

18 responsive to detecting the change, dynamically reconfiguring the at least
19 one subset of nodes with which the first node maintains communications to
20 provide collective connectivity between each of the nodes in a manner that reflects
21 the change.

22
23
24
25

1 19. (Original) A computer-readable medium as recited in claim 14,
2 wherein the computer-executable instructions further comprise instructions for:

3 identifying a particular cone of degree α that is within a boundary node's
4 transmission radius that is not covered by at least one other node of the nodes, α
5 being less than or equal to $5\pi/6$; and

6 decreasing the boundary node's transmission radius to exclude other nodes
7 of the nodes that were acquired within the boundary node's transmission radius as
8 part of an attempt to communicate with a nodes of the nodes in the particular cone.

9
10 20. (Original) A computer-readable medium as recited in claim 14,
11 further comprising instructions for removing a special edge from the wireless
12 multi-hop network, an edge being a communication pathway between at least two
13 nodes of the nodes, and wherein an edge is a special edge if: (a) a first node of the
14 at least two nodes is inside of a first transmission radius that corresponds to a
15 second node of the at least two nodes; and (b) the second node is outside of a
16 second transmission radius that corresponds to the first node.

1 21. (Original) A computer-readable medium as recited in claim 14,
2 wherein the instructions for discovering the neighboring nodes further comprise
3 instructions for:

4 broadcasting the outgoing signal in all directions at a portion of a
5 substantially optimal termination power;

6 receiving the incoming signals; and

7 wherein making the respective decision further comprises:

8 determining whether a predetermined criteria has been met; and

9 responsive to determining that the predetermined criteria has not been met:

10 (a) increasing the portion by a quantum;

11 (b) re-broadcasting the outgoing signal at the portion;

12 (c) receiving a set of incoming signals;

13 (d) determining whether the predetermined criteria has been met; and

14 (e) responsive to determining that the predetermined criteria has not been
15 met, repeating (a) through (e) until either the predetermined criteria is met or until
16 the portion reaches the substantially optimal termination power.

17
18 22. (Original) A computer-readable medium as recited in claim 21,
19 wherein the substantially optimal termination power is less than or equal to a
20 node's maximum transmission power.
21
22
23
24
25

1 23. (Currently amended) A method computer-readable medium as
2 recited in claim 21, wherein the predetermined criteria is based on identifying at
3 least one node of the neighboring nodes within each of a plurality of cones of
4 degree α , each cone being centered on the respective node and spanning a degree
5 of $\alpha/2$ on each side of the at least one node, the cones collectively spanning 2π
6 degrees around the respective node.

7
8 24. (Original) A computer-readable medium as recited in claim 23,
9 wherein $\alpha \leq 5\pi/6$.

10
11 25. (Original) A computer-readable medium as recited in claim 14,
12 wherein an edge is a communication pathway between at least two nodes of the
13 nodes, wherein connectivity in the multi-hop network is represented by a plurality
14 of edges in a topological graph, and wherein the computer-executable instructions
15 further comprise instructions for removing a redundant edge from the wireless
16 multi-hop network.

1 26. (Original) A computer-readable medium as recited in claim 25,
2 wherein the computer-executable instructions for removing the redundant edge
3 further comprises instructions for:

4 assigning each edge (u, v) an edge ID as represented by:

5 $eid(u, v) = (i1, i2, i3),$

6 where $i1 = d(u, v)$, $i2 = \max(\text{node IDs of } u \text{ and } v)$, and $i3 = \min(\text{node IDs}$
7 $\text{of } u \text{ and } v)$; and

8 comparing edge IDs based on lexicographical order, wherein given any $\theta \leq$
9 $\pi/3$ and given any pair of edges (u, v) and edges (u, w) such that angle $vuw < \theta$, a
10 communication pathway between nodes (u, v) is a redundant edge if a first edge
11 ID of (u, v) is greater than a second edge ID (u, w).

1 27. (Original) A computing device comprising:

2 a memory comprising computer-executable instructions for providing
3 location-based topology control to a wireless multi-hop network comprising a
4 plurality of nodes;

5 a processor that is operatively coupled to the memory, the processor being
6 configured to fetch and execute the computer-executable instructions from the
7 memory, the computer-executable instructions comprising instructions for:

8 for each node, discovering a set of neighboring nodes of the nodes using a
9 set of incoming signals from the neighboring nodes, the incoming signals being
10 responsive to receipt by the neighboring nodes of an outgoing signal from a
11 respective node of the nodes;

12 for each node, making a respective decision about a substantially optimal
13 transmission power to communicate with at least one subset of the neighboring
14 nodes, the respective decision being based on the incoming signals and being
15 independent of positional information;

16 for each node, maintaining communications with the at least one subset to
17 provide connectivity between each of the nodes.

18
19 28. (Original) A computing device as recited in claim 27, wherein
20 collectively each respective decision provides substantially complete connectivity
21 between the nodes in a power efficient manner.

22
23 29. (Original) A computing device as recited in claim 27, wherein an
24 incoming signal comprises directional information.
25

1 30. (Original) A computing device as recited in claim 27, wherein an
2 incoming signal comprises directional information and an indication of
3 transmission power used by a neighboring node of the neighboring nodes to
4 communicate the incoming signal.

5
6 31. (Original) A computing device as recited in claim 27, wherein the
7 computer-executable instructions further comprise instructions for:

8 detecting a change in topology of the wireless multi-hop network by a first
9 node of the nodes, the change corresponding to a second node of the nodes
10 entering or leaving a radius of coverage corresponding to the first node; and

11 responsive to detecting the change, dynamically reconfiguring the at least
12 one subset of nodes with which the first node maintains communications to
13 provide collective connectivity between each of the nodes in a manner that reflects
14 the change.

15
16 32. (Original) A computing device as recited in claim 27, wherein the
17 computer-executable instructions further comprise instructions for:

18 identifying a particular cone of degree α that is within a boundary node's
19 transmission radius that is not covered by at least one other node of the nodes, α
20 being less than or equal to $5\pi/6$; and

21 decreasing the boundary node's transmission radius to exclude other nodes
22 of the nodes that were acquired within the boundary node's transmission radius as
23 part of an attempt to communicate with a nodes of the nodes in the particular cone.

24

25

1 33. (Original) A computing device as recited in claim 27, further
2 comprising instructions for removing a special edge from the wireless multi-hop
3 network, an edge being a communication pathway between at least two nodes of
4 the nodes, and wherein an edge is a special edge if: (a) a first node of the at least
5 two nodes is inside of a first transmission radius that corresponds to a second node
6 of the at least two nodes; and (b) the second node is outside of a second
7 transmission radius that corresponds to the first node.

8
9 34. (Original) A computing device as recited in claim 27, wherein the
10 instructions for discovering the neighboring nodes further comprise instructions
11 for:

12 broadcasting the outgoing signal in all directions at a portion of a
13 substantially optimal termination power;

14 receiving the incoming signals; and

15 wherein making the respective decision further comprises:

16 determining whether a predetermined criteria has been met; and

17 responsive to determining that the predetermined criteria has not been met:

18 (a) increasing the portion by a quantum;

19 (b) re-broadcasting the outgoing signal at the portion;

20 (c) receiving a set of incoming signals;

21 (d) determining whether the predetermined criteria has been met; and

22 (e) responsive to determining that the predetermined criteria has not been
23 met, repeating (a) through (e) until either the predetermined criteria is met or until
24 the portion reaches the substantially optimal termination power.

25

1 35. (Original) A computing device as recited in claim 34, wherein the
2 substantially optimal termination power is less than or equal to a node's maximum
3 transmission power.

4
5 36. (Original) A computing device as recited in claim 35, wherein the
6 predetermined criteria is based on identifying at least one node of the neighboring
7 nodes within each of a plurality of cones of degree α , each cone being centered on
8 the respective node and spanning a degree of $\alpha/2$ on each side of the at least one
9 node, the cones collectively spanning 2π degrees around the respective node.

10
11 37. (Original) A computing device as recited in claim 36, wherein $\alpha \leq$
12 $5\pi/6$.

13
14 38. (Original) A computing device as recited in claim 27, wherein an
15 edge is a communication pathway between at least two nodes of the nodes,
16 wherein connectivity in the multi-hop network is represented by a plurality of
17 edges in a topological graph, and wherein the computer-executable instructions
18 further comprise instructions for removing a redundant edge from the wireless
19 multi-hop network.

1 39. (Original) A computing device as recited in claim 38, wherein the
2 computer-executable instructions for removing the redundant edge further
3 comprise instructions for:

4 assigning each edge (u, v) an edge ID as represented by:

5 $eid(u, v) = (i1, i2, i3)$,

6 where $i1 = d(u, v)$, $i2 = \max(\text{node IDs of } u \text{ and } v)$, and $i3 = \min(\text{node IDs}$
7 of u and v); and

8 comparing edge IDs based on lexicographical order, wherein given any $\theta \leq$
9 $\pi/3$ and given any pair of edges (u, v) and edges (u, w) such that angle $vuw < \theta$, a
10 communication pathway between nodes (u, v) is a redundant edge if a first edge
11 ID of (u, v) is greater than a second edge ID (u, w).
